TITLE: Relationship between the wetting effect, molecular balance, and surface-active properties of alkyl sulfate solutions

SOURCE: Maslozhivotnaya promyshlennost', no. 7, 1965, 12-17

TOPIC TAGS: alkyl sulfate, wetting agent, surface active agent, surface tension, foaming capacity

ABSTRACT: Commercial alkyl sulfates and their mixtures (ASt, mol. wt. 290; ASn, mol. wt. 298; ASp, mol. wt. 299; AS₃, mol. wt. 320) were studied at 50°C in water, and also with admixtures of sodium sulfate, sodium carbonate, and sodium tripolyphosphate. The surface tension at the solution - air interface, the foaming capacity, and the wetting effect were determined, and the critical micelle concentration was measured with pinacyanol chloride. A quantitative relationship was found between the wetting effect of alkyl sulfate solutions and the ratio of the critical concentration of formation of a saturated adsorption layer at the solution - air interface to the critical concentration of formation of micelles in the volume of the solution (this ratio characterizes the molecular balance). A quantitative

Card 1/2

L 62948-65
ACCESSION NR: AP5019286

2

relationship was also observed between the wetting effect and the second and third critical concentrations, which were determined from the foaming capacity. The optimum wetting concentration is 1.6-14.7 times greater than the critical micelle concentration, depending upon the nature of the alkyl sulfate. This ratio remains constant with a changing amount of electrolyte. Depending upon the nature and quantity of the electrolytes, the optimum wetting concentration decreases in their presence to 0.8-0.5 of the original value. Electrolytes increase the wetting effect of alkyl sulfates, particularly those which have a low wetting effect in the pure state. In the presence of sodium tripolyphosphate, an equalization (leveling) of the wetting effect of the investigated commercial alkyl sulfates takes place, and the effect assumes its highest values. Orig. art. has: 2 figures, 2 tables, and 7 formulas.

TITLE: Measurement of electromagnetic parameters of magnetized ferrites by the resonator method

25

SOURCE: IVUZ. Fizika, no. 4, 1965, 66-71

TOPIC TAGS: ferrite, cavity resonator, magnetic permeability, dielectric constant, magnetization curve, magnetic field measurement, electric measurement

ABSTRACT: This paper was reported at the Third All-Union Scientific and Technical Conference on Ferrites held in Leningrad on 24 October 1963. The authors describe a test setup for the measurement of the dielectric constant and the components of the magnetic permeability tensor of a magnetized ferrite as functions of the external magnetic field (from 0 to 50 oe). The measurement procedure is based on the use of a cylindrical resonator excited by circularly polarized waves, described by H. E. Bassey and L. S. Steinert (Trans. IRE MTT-6, No. 1, 72, 1958). Formulas are derived for the determination of the dielectric constant, the permeability matrix components, and the relative frequency deviation in the cavity. The method also makes it possible to determine the magnetization curve of the magnetized ferrites. The experimental curves obtained with the apparatus were in agreement with the

Card 1/2

2

L 8600-66
ACCESSION NR: AP5021169

theoretical deductions. Measurement results are presented for Mg--Cr--Cu ferrites. An accuracy of not more than 10% for the dielectric constant and 1--2% for the permeability are claimed. Orig. art. has: 3 figures and 6 formulas.

Orig Pub: Pchelvodstvo, 1958, No 1, 57-58.

Abstract: In experiments at the Orlov Experimental Apiculture Station, the method of obtaining mature queen bee cells, which includes the division of the nest in two with division by a fine screen, is completely in perspective. For obtaining good queen bee cells, it is necessary that the bee colony be not only highly productive and strong, but also be found prepared to swarm.

TITLE: Investigation of the ethylene polymerization reaction in the presence of the soluble catalyst system Sn (C₆H₅)₄ - AlBe - VCl

SOURCE: Neftekhimiya, v. 4, no. 1, 1964, 43-52

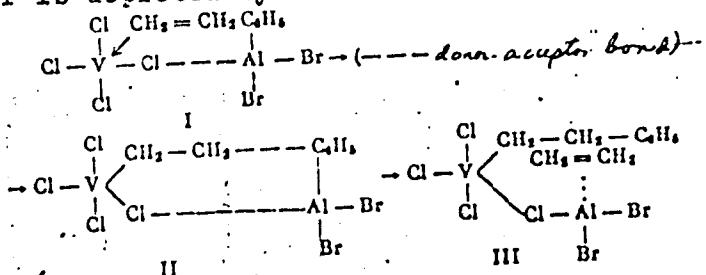

TOPIC TAGS: ethylene, polymerization, polymerization catalyst, Ziegler catalyst, soluble catalyst system, vanadium containing catalyst system, catalyst mechanism, polyethylene, catalyst component ratio, linear polymer, crystalline polymer, crystalline polyethylene, molecular weight distribution, electron microscope, polyethylene monocrystal, propylene polymerization, vanadium tetrachloride containing catalyst, tin tetraphenyl containing catalyst

ABSTRACT: The polymerization of ethylene in the presence of the soluble catalyst system was investigated to explain the mechanism of the catalyst action and the characteristics of the polymer obtained. Examination of the catalyst component ratios indicated that a 1:1 ratio of AlX₃:Sn(C₆H₅)₄ results in a practically inactive catalyst;

Card 1/4

ACCESSION NR: AP4024402

its activity increases up to a 2:1 ratio and remains fairly constant thereafter. Interaction between these components is depicted by:
 $\text{Sn}(\text{C}_6\text{H}_5)_4 + 3\text{AlBr}_2 \rightarrow 2\text{AlC}_6\text{H}_5\text{Br}_2 + \text{Sn}(\text{C}_6\text{H}_5)_2\text{Br}_2 + \text{AlBr}_3$, where AlBr_3 in excess of 2 moles remains unreacted. Very small amounts of VCl_4 are required since an excess causes dearylation of the aluminum-organic complex. With 1.2×10^{-7} millimoles VCl_4 a 25% yield of high viscosity (2.80) polyethylene is obtained; with 0.03 millimoles the yield is similar but the viscosity of the material has dropped to 1.50; and with 0.06 millimoles the yield suddenly drops to 5%, and the viscosity to 1.10. The second stage of forming the active catalyst complex between $\text{AlC}_6\text{H}_5\text{Br}_2$ and VCl_4 , which appears to require the presence of monomer is depicted by:

Card 2/4

ACCESSION NR: AP4024402

An investigation of the properties of the obtained polyethylene shows it is strictly linear, has a high degree of crystallinity, a high fusion temperature and very narrow molecular weight distribution. An electron microscope study of the supermolecular structure disclosed the presence of monocrystals in unfractionated polyethylene, confirming that groups of polymeric chains are uniform not only in structure but in the size of the structural units. By comparing the properties of polyethylene obtained with dissolved catalyst systems (i.e., the system discussed and said system with $TiCl_4$), and the conventional heterogeneous Ziegler catalyst and the latter containing the transition metal salt VCl_4 , led to the conclusion that the chemical structure of the polyethylene macromolecule is not determined by the solubility of the polymerization catalyst but by the nature of the active growth center of the polymeric chain. Polymerization of propylene was unsuccessful under the various conditions favorable to ethylene polymerization. "Spectra were taken in collaboration with the laboratory of L. S. Polak in the Institute of Nuclear Physics, MGU". "Electron microscope investigations at electron

TITLE:

Application of vertical electrical sounding for the investigation of seasonal freezing and thawing of grounds

PERIODICAL: Geologiya i Geofizika, no. 1, 1962, 143-146

TEXT: The application of the electrometric method for the investigation of seasonal freezing of grounds is discussed. The following characteristics, contrasting with the case of permanently frozen grounds, are taken into account: the depths of frost penetration are small and change in the course of the year; the conditions of temperature are not constant in time and in depth. It was necessary to make measurements at more frequent intervals, which ensured a more detailed registration of divisions throughout the entire depth of the vertical cut. Vertical electrical sounding was carried out at the terraces of the river Bayandaika. A five-layer curve was obtained, the layers corresponding to grounds of different lithological composition and contents of moisture. The measurements in weakly-dispersed grounds (dry sands, etc) must be made during the period of maximal freezing, when the temperature of the frozen layer is lower than -5°. At higher temperatures and a low moisture content of the ground, the resistances of frozen and thawed sands do not differ greatly and the boundaries obtained are not precise, resulting in gross errors in the measurement of thickness, under and the boundaries obtained are not precise, resulting in gross errors in the measurement of thickness, under

conditions of deep seasonal freezing of ground the electrometric method may be applied in order to solve the following problems: 1) determination of the layer of seasonal freezing and thawing of loose grounds with the error of depth not exceeding 10%; 2) discovery of seams of ice, the resistance of which is much higher than that of the surrounding thickness of frozen ground. 3) lithological differentiation of sections according to resistivities of various grounds, and differentiation of these grounds as to the moisture content. There are 3 figures, 1 table and 1 reference.

TOPIC TAGS: frozen ground, permafrost, geocryology, cryopedology, mapping, geomorphology, geologic survey, surface water / Irkutsk

ABSTRACT: Examples are given of mapping frozen ground, especially permafrost, regions developed at the Department of Geocryology of Moscow State University by Prof. V. A. Kudryavtsev. The views of P. F. Shvetsov with respect to the shortcomings of purely zonal mapping without regard to genetic anomalies are noted and supported. A detailed permafrost map of the Irkutsk region, compiled by F. N. Leshchikov in 1964, is presented and analyzed. The map illustrates

Card 1/2

ACC NR: AT7001843

that the nature of the bedding and individual quantitative elements of seasonally frozen ground and permafrost in the Irkutsk region is determined primarily by the geostructural plan of development, the lithological composition of the rocks, the depth of water-bearing horizons, the movement of ground water, as well as by the overall geographic characteristics of the region. Thus, the distribution pattern of permafrost is most reliably demonstrated by a supporting analysis of geologic processes. The map defines distinct frozen ground provinces in the southern area of the Siberian platform and in the Sayan Baykal folded zone. Orig. art. has: 1 figure. [W.A.79-67-4]

TITLE: Synthesis and properties of polyaryl esters containing carboxyl groups 1

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 4, 1965, 734-746

TOPIC TAGS: polyaryl ester, carboxyl group, heat resistant polymer

ABSTRACT: New polyaryl esters containing free carboxyl groups have been prepared and some of their properties have been studied. The introduction of carboxyl groups was of interest as a means of imparting to the polymers solubility in alkalies and ion exchange properties, and of increasing heat resistance via the formation of salt-like cross-links. Polymeric and copolymeric polyaryl esters were prepared by interfacial polycondensation of trimesinyl dichloride (I) and/or terephthaloyl chloride (II) and 4,4'-dihydroxy-2"-carboxytriphenylmethane (III) and/or 2,2-bis(4-hydroxyphenyl)propane (IV) in sodium hydroxide solution at room temperature. The properties of the polyaryl esters

Card 1/2

L.44132-65

ACCESSION NR: AP5011256

were highly dependent on the monomer structures. All polyaryl esters from I were poorly soluble in dilute alkalies, but soluble in stronger alkalies with hydrolysis. Polymers from I and IV were also poorly soluble in cresol and tetrachloroethane; with the addition of II, solubility in cresol appeared. Polymers from II and III were soluble in dilute alkalies in the cold and in cresol. The polyaryl esters melted with decomposition in the range 240—320°C. Orig. art. has: [SM]

TITLE: Introduction of terminal aromatic amino groups in poly- ϵ -caproamide using m-phenylenediamine and its hydrochloride

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 8, 1966, 1423-1427

TOPIC TAGS: caprolactame, chlorohydrate, polymerization

ABSTRACT: A process has been studied for hydrolytic ϵ -caprolactame polymerization in the presence of m-phenylenediamine and anhydrous or crystalline soda. Optimum correlations of these reagents are found which permit the maximum number of terminal aromatic aminogroups to be introduced in poly- ϵ -caproamide with a conservation of high molecular weight. It is shown that the addition of dimethylterephthalate in the presence of m-phenylenediamine permits the concen-

TITLE: Synthesis and properties of carboxyl-containing polyamides

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 5, 1965, 813-816

TOPIC TAGS: polymer, resin, polyamide, polyamide plastic, polycondensation

ABSTRACT: This report is an extension of the method for obtaining hetero-chain polymers with active groups in side chains to polyamides. The introduction of carboxyl groups was undertaken in the hope to increase the solubility and thermal stability of polyamides and to render them useful as ion exchangers. The synthesis consisted of interfacial polycondensation at room temperature of halides of dicarboxylic acids with aliphatic and aromatic diamines. The monomers used were: dichloroanhydride of trimesic acid, (X_1) N-(6-aminohexyl)- ω -aminocentantic acid (A), dicylchlorhydrate of N,N' -di-(6 carboxyhexyl)-n-phenylenediamine (N) dichloroanhydride of terphthalic acid (X_2), dichloroanhydride of sebacic acid (X_3), dichlorohydrate of m-phenylenediamine (M), dichlorohydrate of n-phenylenediamine

(P), trans-n-diaminocyclohexane (T), piperazine (D), and 1,6-hexamethylenediamine (G). The polymers obtained are not thermostable and are soluble in alkalies. The polymer alkali metal salts exchange ions with a number of metal salts and mineral acids with the formation of insoluble carboxyl-containing polyamides. Orig. art. has: 2 tables.

TOPIC TAGS: polymer, amino acid, polyamide, polymerization, molecular weight,
~~polycaproamide~~ amino group

ABSTRACT: The hydrolytic polymerization process of ~~captoprolactam~~ in the presence of aromatic diamines and other aminocarboxylic acids has been investigated. It was shown that these compounds are regulators of the molecular weight of the poly-*c*-caproamide and that through them it is possible to introduce into the polymer a certain number of aromatic amino groups to preserve the fiber-productive capacity. A method of quantitative determination of small concentrations of aromatic amino groups in the polycaproamide was developed. Orig. art. has: 4 figures, 3 formulas, and 1 table.

TITLE: On the long-range supersonic [aircraft]. Peculiarities of fuel systems

SOURCE: Aviatsiya i kosmonavtika, no. 11, 1966, 69-74

TOPIC TAGS: supersonic aircraft, supersonic transport, ~~engine fuel system~~, aircraft fuel system, aircraft fuel pump, aircraft fuel system equipment, aircraft fuel tank

ABSTRACT: Many special problems with fuel systems will be encountered in designing supersonic aircraft, which will require many novel solutions. Center of gravity will be controlled in flight by fuel transfer. Since at Mach 2.5—2.7 fuel-tank walls will reach the fuel's autoignition temperature, fuel tanks will be pressurized with an inert gas such as nitrogen. Another measure is to use the fuel from the wing tanks and those located next to the engines first. In order to minimize the aircraft's dry weight, heat insulation is normally used only in the tanks to be emptied last. Also effective are baffles placed along the bottom of the tank, since they greatly reduce heat transfer by interfering with free convection. The fuel temperature in an aircraft flying 2—3 hr at Mach 2.2—3.0 can reach 80—120°C. At temperatures above 100°C, partial oxidation of fuel takes place, and even small quantities of such impurities as sulphur, nitrogen, oxygen, copper, iron, lead, or zinc can accelerate this process; insoluble matter and resin-

Card 1/3

L 10015-67

3

ous deposits settle in the fuel tanks, and these lead to a number of fuel-system problems. Since standard fuels possess a sufficiently high thermal stability during short-term heating to 180—200C, the fuel temperature in the tank-to-engine portion of the fuel system can increase to 80—100C. Fuel fed to the engines is normally used for cooling hydraulic systems, electronic equipment, lubrication systems, and air in the conditioning system. To use fuel most effectively as a heat sink, paraffin-base fuels are preferred due to their high thermal capacity. Other means of solving the heating problems are to increase the fuel flow rate through hot areas and to avoid the formation of stagnation zones. Fuel makes up more than a half of the take-off weight of a heavy aircraft with a speed of 3200 km/hr. This increases the demands placed on the system, forcing designers to devote much attention to fuel systems and to provide redundant or backup systems where they are critical. Concerning the selection of fuels, it is estimated that the use of high-caloric hydrocarbons could increase range by up to 12%. On long-range supersonic aircraft there is a requirement for an increased fuel-tank pressurization level, which is determined primarily by the fuel-vapor pressure and the drop in pressure at the pump intake. This is why heavy hydrocarbon fuels with a high boiling point are coming into use on supersonic aircraft. To improve the cavitation characteristics of centrifugal pumps, an axial impeller is used which is 2—3 times as efficient as a centrifugal one. The additional pressure created by the axial impeller, located ahead of the centrifugal-impeller intake, improves the pump's cavitation characteristics, as does the use of an electrically driven pump with preejector. With an increase in the maximum fuel temperature in the tank from 50 to 120C, the electric motor's weight increases two times; thus,

Card 2/3

L 10015-67
ACC NR: AP6036175

electrically driven pumps become so large and heavy that their placement in the tanks is extremely difficult. Weight can be cut almost in half by using gas and air turbines to drive the fuel pumps. Since calculations show that the air turbine requires 2-3 times more fuel per effective horsepower than does the electric drive, however, its extensive use in some cases can adversely affect an aircraft's flying characteristics. Although the use of an air turbine is not the best solution from the standpoint of overall characteristics and efficiency, its use is the only practical alternative in those cases where it is not possible to use power takeoff. More practical are hydraulic-turbine-powered pumps, which combine the simplicity of the pneumatic turbine drive with the high efficiency of the hydraulic transmission. Such turbines can use either fuel or hydraulic fluid from the aircraft's control system as a working fluid. Orig. art. has: 4 figures.

TITLE: The Petroleum Industry in Venezuela (Neftyanaya pro-myshlennost' Venesuely)

PERIODICAL: Neftyanoye Khozyaystvo, Nr.4, 1957, pp.63-66 (USSR)

ABSTRACT: The author describes all the aspects of the Venezuelan petroleum industry. He states that Venezuela is second in the production of petroleum. While in 1955 total production amounted to 115.4 million tons of crude petroleum, in 1956 it was 131 million tons. Venezuela's exports constituted 40% of world oil exports. As of January 1, 1956, the petroleum reserves of Venezuela were estimated at 1,829 million tons. The author describes in details the three main oil basins of Venezuela - Maracaibo, Orinoco, and Apure. Later, the author gives total (from 1917 to 1956) oil production figures and discusses the Venezuelan petroleum companies, their individual share in production, production averages per well, the application of secondary recovery methods, drilling statistics, number of depleted wells, gas wells, gas reserves and uses, gas pipelines, refineries, their
